CLINICAL MEASUREMENTS

PARAMETER	RESULT	NORMAL RANGE	STATUS
Blood Pressure	100 mmHg	90–120	NORMAL
Cholesterol	100 mg/dL	< 200	NORMAL
Heart Rate	84 bpm	60–100	NORMAL
Fasting Blood Sugar	Yes (>120 mg/dL)	No (< 120)	ABNORMAL
Chest Pain Type	Non-anginal Pain	Asymptomatic	ABNORMAL
Resting ECG	ST-T Wave Abnormality	Normal	ABNORMAL
Exercise Induced Angina	Yes	No	ABNORMAL
ST Depression (Oldpeak)	2	< 1.0	ABNORMAL
ST Slope	Upsloping	Upsloping	NORMAL
Blocked Vessels (0-3)	0	0	NORMAL
Thalassemia	Normal	Normal	NORMAL

 PREDICTIVE RISK ESTIMATION

OVERALL ASSESSMENT STATUS

HIGH RISK

RISK PROBABILITY

63%

MODEL CONFIDENCE SCORE

63.0%

PRIMARY RISK FACTOR (SHAP)

 MODEL INTERPRETATION & SHAP EXPLAINABILITY

Based on the comprehensive physiological assessment, the trained supervised machine learning model evaluated on the Cleveland Heart Disease Dataset classifies this patient profile as a **High Risk** for cardiovascular complications. The algorithm determined a risk probability of **63%** with a confidence score of **63.0%**. Other contributing clinical indicators were weighted simultaneously by the Random Forest classifier to finalize this diagnostic prediction. This assessment relies on correlations learned from historical medical datasets and must be interpreted alongside clinical expertise.

DIET & NUTRITION

- ✓ Metabolic Warning: Elevated fasting blood sugar (> 120 mg/dL), indicative of pre-diabetes or diabetes. Monitor glycemic levels closely. Reduce sugar and refined carbs. Schedule an HbA1c test.

PHYSICAL ACTIVITY

- ✓ Cardiac capacity: Low maximum heart rate (84 bpm) during testing. Cardiovascular training like brisk walking, cycling, or swimming is recommended to improve cardiac output. Speak with a doctor first.
- ✓ Symptom Warning: Exercise-induced chest pain (angina) detected. Avoid strenuous exertion without medical supervision. Always carry prescribed quick-relief medication if applicable.

MEDICAL FOLLOW-UP & MONITORING

- ✓ Cardiac capacity: Low maximum heart rate (84 bpm) during testing. Cardiovascular training like brisk walking, cycling, or swimming is recommended to improve cardiac output. Speak with a doctor first.
- ✓ Symptom Warning: Exercise-induced chest pain (angina) detected. Avoid strenuous exertion without medical supervision. Always carry prescribed quick-relief medication if applicable.
- ✓ Metabolic Warning: Elevated fasting blood sugar (> 120 mg/dL), indicative of pre-diabetes or diabetes. Monitor glycemic levels closely. Reduce sugar and refined carbs. Schedule an HbA1c test.
- ✓ URGENT: High cardiovascular risk score. Schedule a comprehensive cardiology consultation immediately for a stress test, ECG, or echocardiogram.

DISCLAIMER

This report has been generated using a trained supervised machine learning model validated on the Cleveland Heart Disease Dataset and is intended for clinical decision support. It must not replace professional diagnosis or treatment by a qualified healthcare provider. CardioGuard Clinical Predictive Analytics does not assume liability for clinical decisions made solely on automated statistical risk scoring. All clinical measurements must be independently verified by a licensed physician.
